Archiviert am: 2025-07-17 18:43:29

You can use spot variants to create different variants of a centrally managed spot, for example, for branches. The spot variants remain connected with the original spot and you can manage them from a central location. That is, in the spot settings of the original spot. In addition, you can change the settings and content of a spot variant independently of the original spot to suit the needs of your branches.

To enable spot variants, perform the following steps:

1. Navigate to the configuration files on the server at: GVServer2\www\gv2\gf\GFWebHtmlCustomer\
2. Open one of the following folders:
 - **00000**: edit configurations for the entire server, which means for all customers.
 - **000xxx**: edit customer-specific settings. xxx is the customer ID.
3. Open the config.json file in your folder with a text editor like Notepad++.
4. Under **cms**, set **spotVariationsEnabled** to **true**.
5. Save your changes and close the file.

```
"cms": {  
  "spotVariationsEnabled": true,  
}
```
